Overview

- ① Neutrino emission from the core-collapse supernovae
- ② Diffuse supernova neutrino background
- ③ The DSNB detection and measurement
- ④ Conclusions

Diffuse supernova neutrino background

Inevitable detection within next 10-15 years

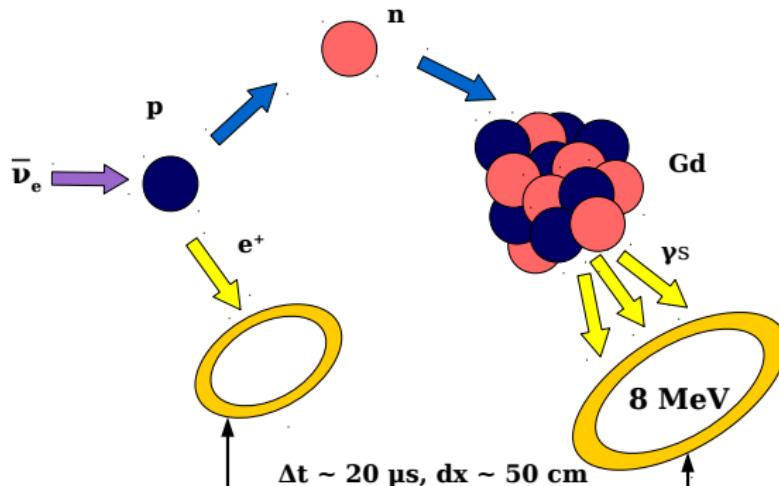

Super Kamiokande (Gd, 2020) $\sim 3\sigma$ within 10 yrs

Gadolinium sulfate enrichment

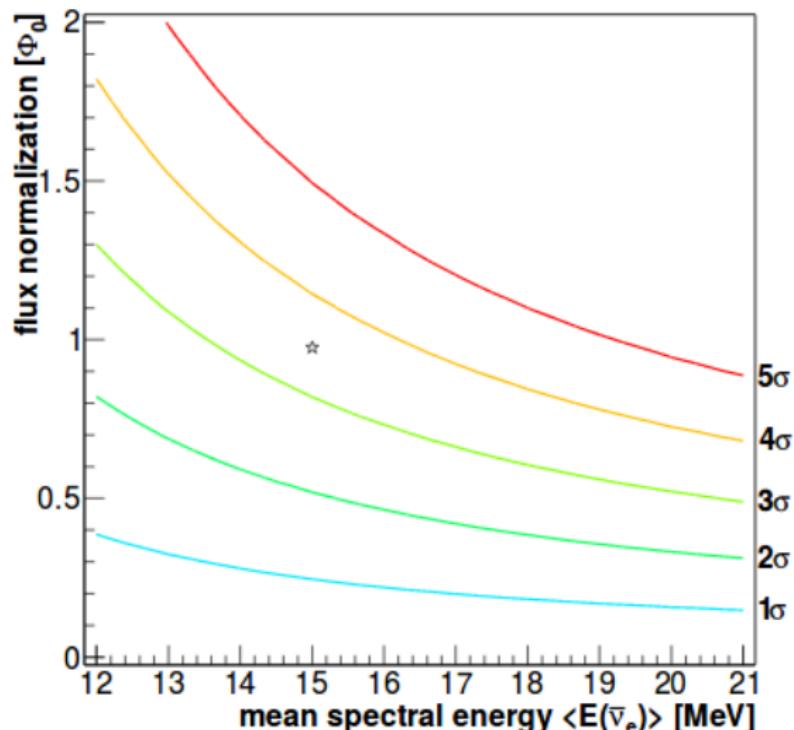

Neutron tagging in Gd-enriched water Cherenkov detectors

- coincidence detection of positron and neutron
- high cross section for neutron capture ~ 4900 barn
- elimination of spallation background
- reduction of invisible muon background

Inevitable detection within next 10-15 years

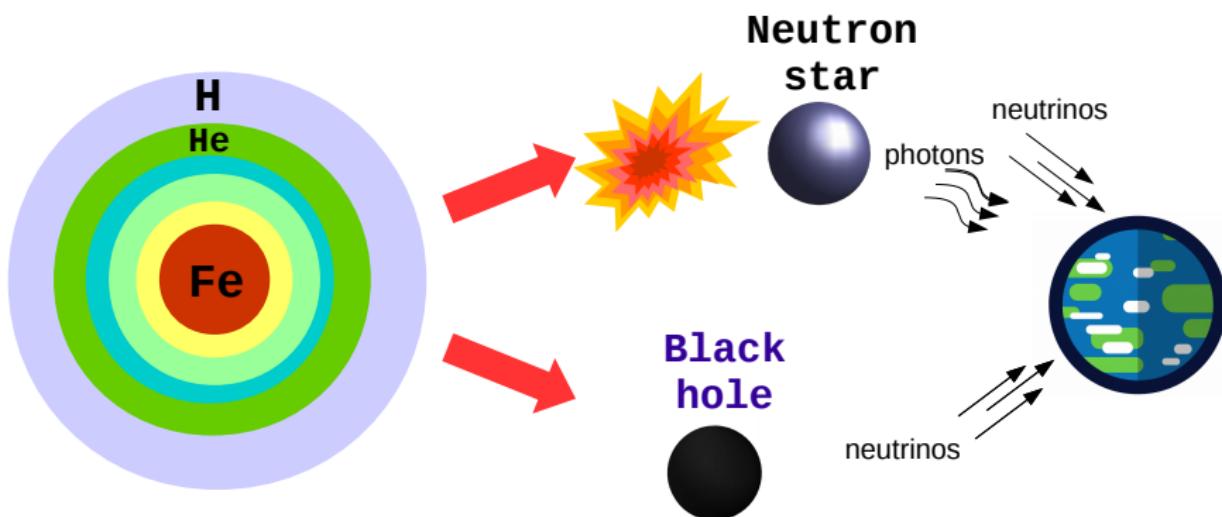

JUNO (2021) $\sim 3\sigma$ within 10 yrs

Core-collapse supernovae

Neutrinos:

- play a crucial role in the explosion mechanism
- can reveal the interior conditions of a collapsing star
- are the only messengers from the collapse to a black hole (+ GW)

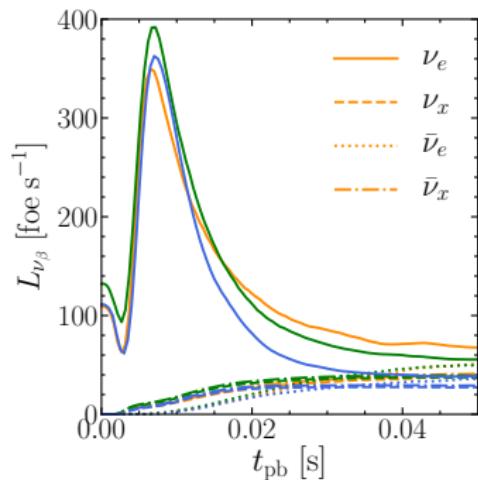

Neutrino emission from the core-collapse supernovae

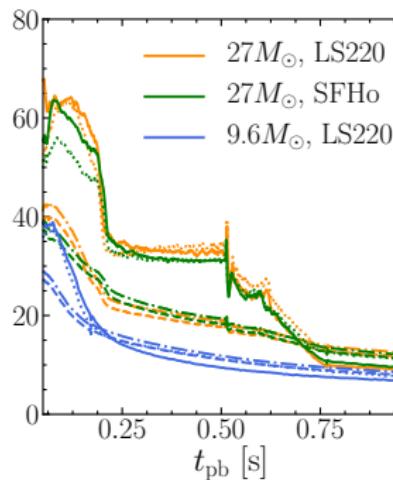

Core-collapse supernovae

1 foe = 10^{51} ergs

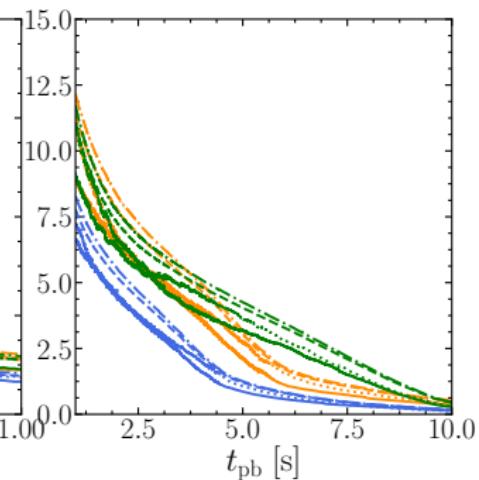

CC-SN progenitors

ν_e burst

accretion

cooling

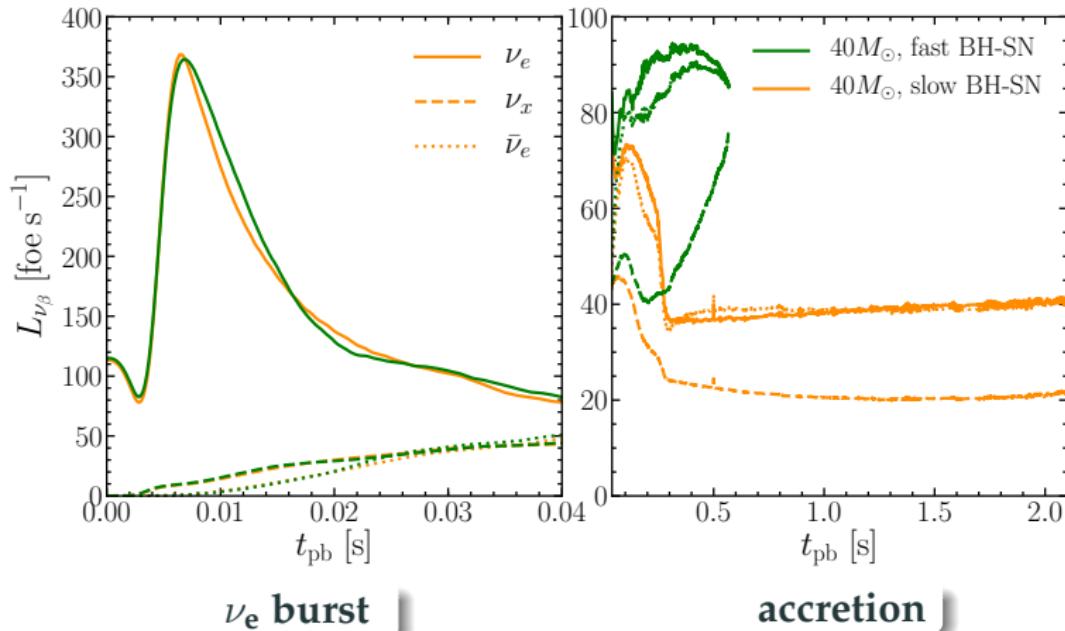

CC-SN

equation of state = LS220 or SFHo, mass = $9.6 M_\odot$ or $27 M_\odot$

Garching core-collapse supernova archive

Failed Supernovae

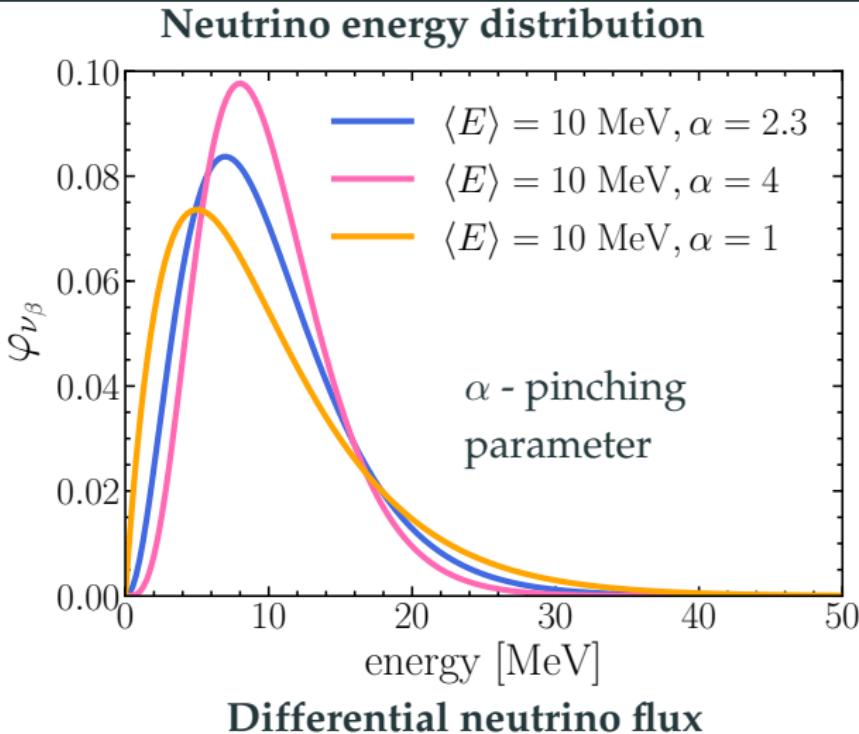

BH-SN progenitors

BH-SN

equation of state = LS220, mass = $40 M_\odot$, $t_{\text{BH}} = 0.57$ s or 2.1 s

Neutrino fluxes

$$f_{\nu_\beta}^0(E, t_{\text{pb}}) = \frac{L_{\nu_\beta}(t_{\text{pb}})}{4\pi r^2} \frac{\varphi_{\nu_\beta}(E, t_{\text{pb}})}{\langle E_{\nu_\beta}(t_{\text{pb}}) \rangle} = \frac{F_{\nu_\beta}^0(E, t_{\text{pb}})}{4\pi r^2}$$

Equation of motion for supernova neutrinos

$$\frac{d}{dr}\rho = -i[H, \rho],$$

vacuum **matter** **neutrino - neutrino**

$$H = U^\dagger \text{diag}(m_1^2, m_2^2, m_3^2) U + \text{diag}(V_{CC}, 0, 0) + \int d^3 p' (\rho - \bar{\rho}) (1 - \vec{v}' \cdot \vec{v})$$

Equation of motion for supernova neutrinos

$$\frac{d}{dr}\rho = -i[H, \rho],$$

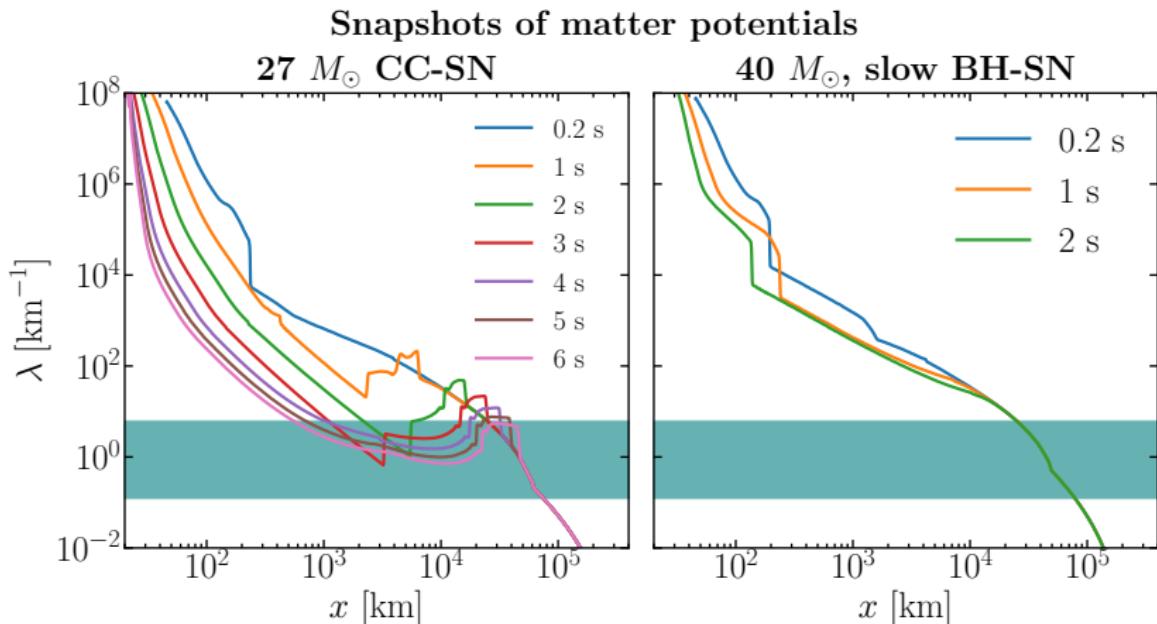

vacuum

matter

neutrino -
neutrino

$$H = U^\dagger \text{diag}(m_1^2, m_2^2, m_3^2) U + \text{diag}(V_{CC}, 0, 0) + \int d^3 p' (\rho = \bar{\rho}) (1 - v' \cdot v)$$

Matter potentials

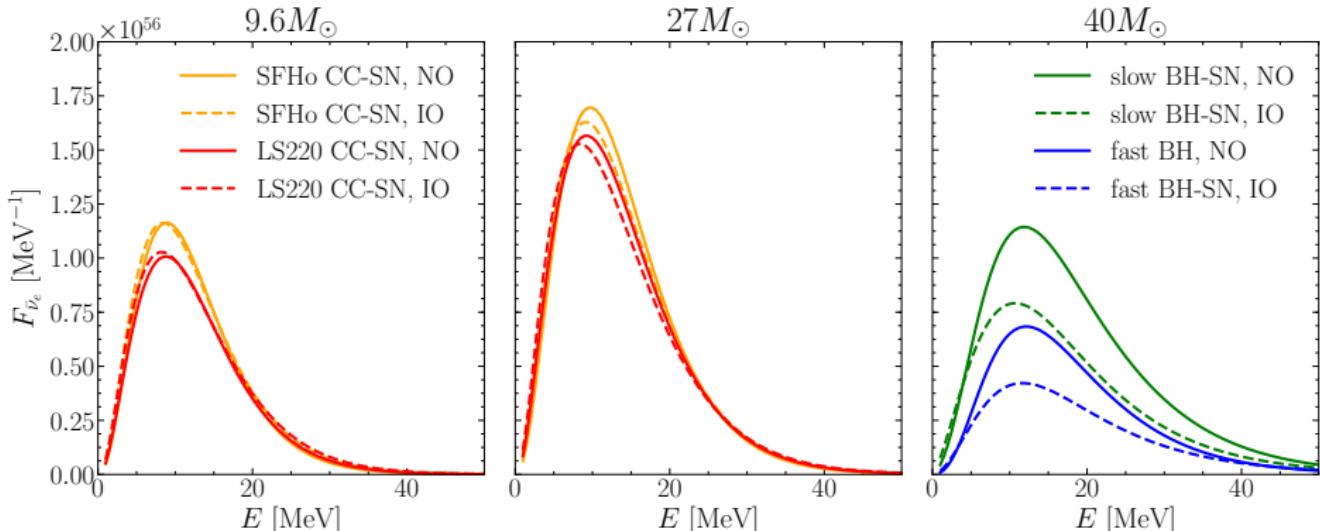

Resonance potential

$$\lambda_{res} = \frac{\cos 2\theta_{13} \Delta m^2}{2E} \approx \cos 2\theta_{13} \left(\frac{\Delta m^2}{\text{eV}^2} \right) \left(\frac{\text{GeV}}{E} \right) [\text{km}^{-1}]$$

Wolfenstein, Phys. Rev. D 17, 2369 , Dighe and Smirnov, arXiv:9907423

Time-integrated neutrino fluxes

	CC-SN	BH-SN
high-energy neutrinos	fewer	more
distinguish progenitor	no	yes
distinguish mass ordering	no	yes

Diffuse supernova neutrino background

Diffuse supernova neutrino background (DSNB)

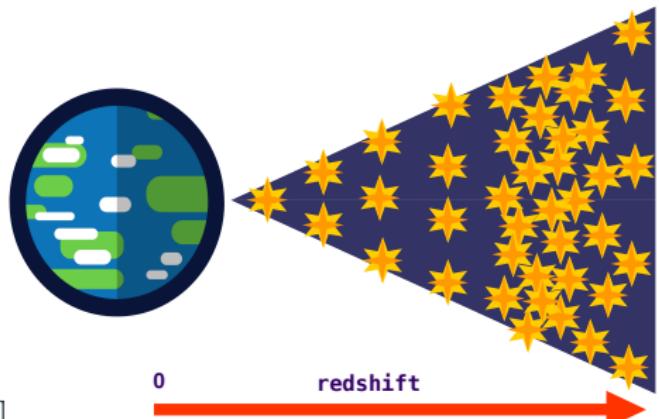

$$\Phi_{\nu_\beta}(E) = \frac{c}{H_0} \int dM \int dz \frac{R_{\text{SN}}(z, M)}{\sqrt{\Omega_M(1+z)^3 + \Omega_\Lambda}} [f_{\text{CC-SN}} F_{\nu_\beta, \text{CC-SN}}(E', M) + f_{\text{BH-SN}} F_{\nu_\beta, \text{BH-SN}}(E', M)]$$

Diagram illustrating the components of the DSNB equation:

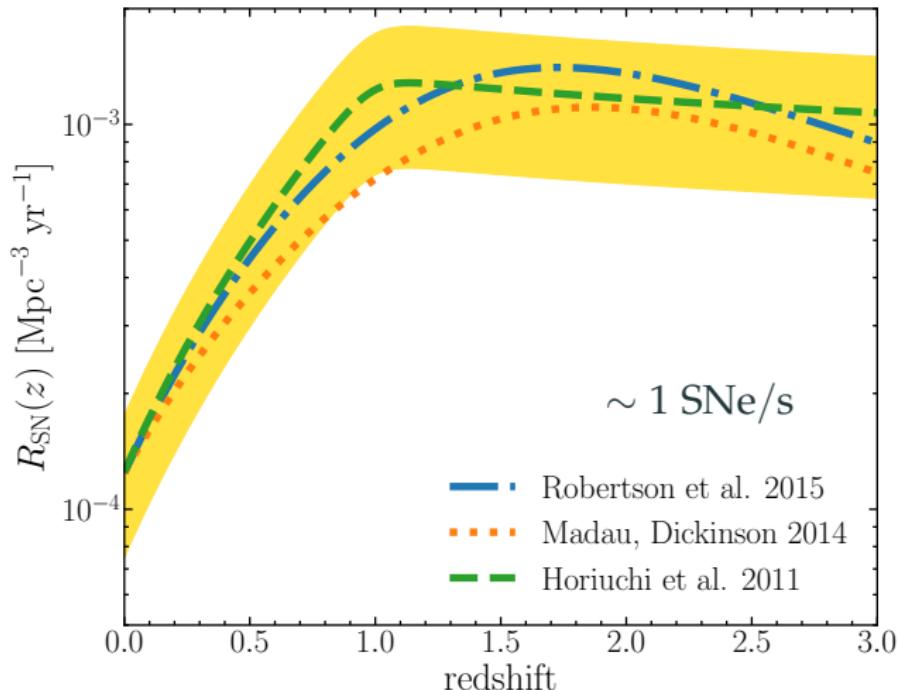

- cosmological supernovae rate**: Points to the term $R_{\text{SN}}(z, M)$.
- fraction of black-hole-forming progenitors**: Points to the term $f_{\text{BH-SN}}$.
- fraction of neutron-star-forming progenitors**: Points to the term $f_{\text{CC-SN}}$.
- oscillated neutrino flux**: Points to the factor $E' = (1+z)E$.

The DSNB is sensitive to:

- R_{SN}
- $f_{\text{BH-SN}}$
- neutrino mass ordering
- equation of state
- mass accretion rate in BH-SN

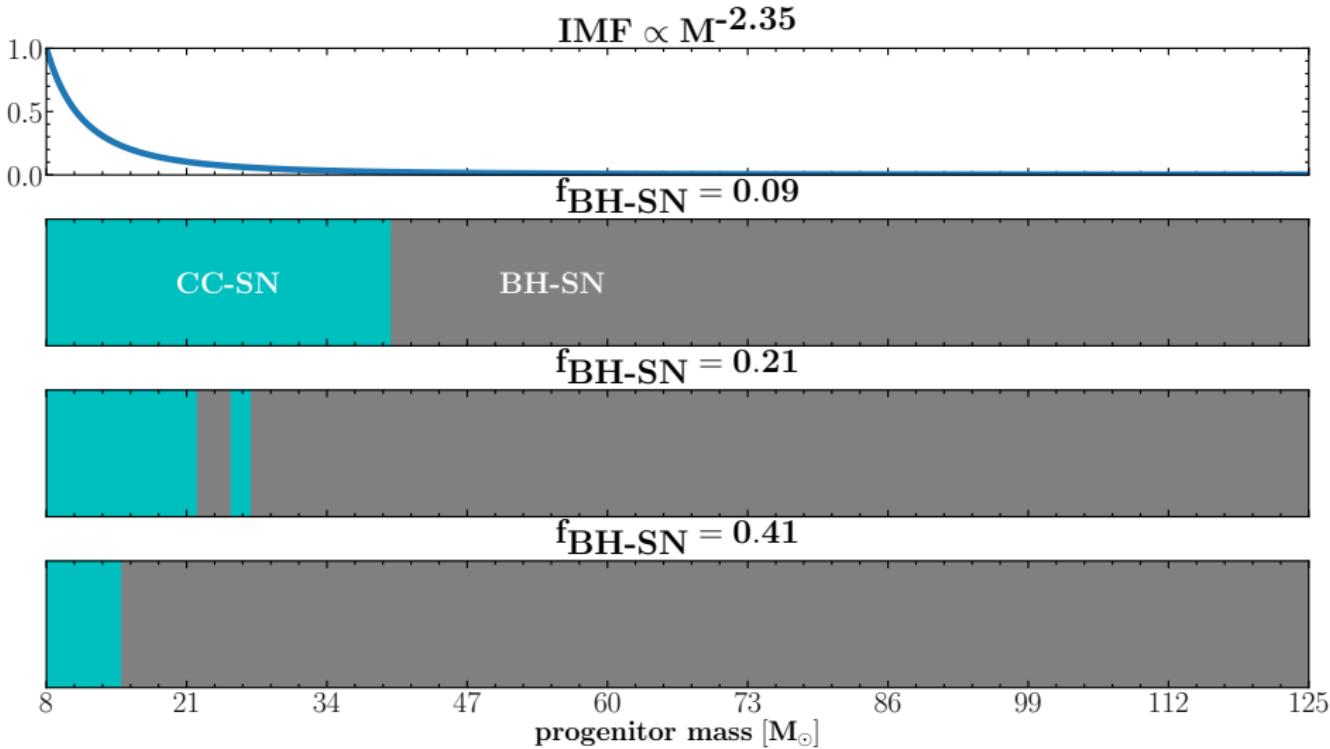

Cosmological supernovae rate

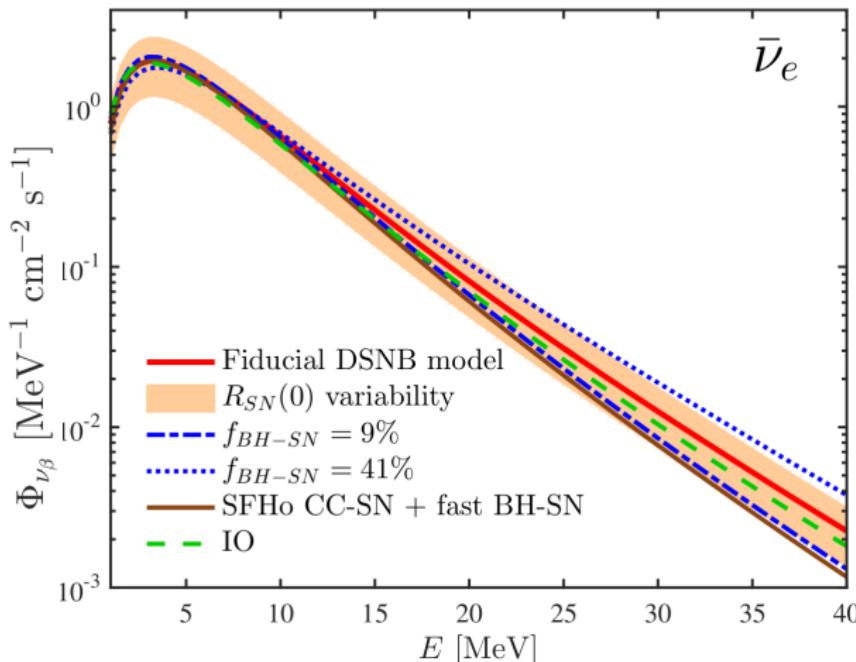

The supernovae rate influences the normalization of the DSNB.

Fraction of BH-forming progenitors

Ertl et al. arXiv:1503.07522, Sukhbold et al. arXiv:1510.04643,
Adams et al. arXiv:1610.02402, Heger et al. arXiv:0112059

Diffuse supernova neutrino background

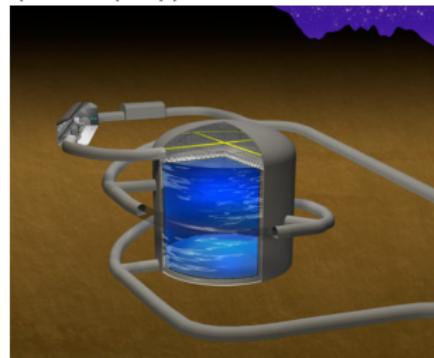

Fiducial DSNB model: $R_{SN}(0) = 1.25 \times 10^{-4} \text{ Mpc}^{-3} \text{ yr}^{-1}$, $f_{BH-SN} = 0.21$,
equation of state = LS220, mass accretion rate = slow

The DSNB detection and measurement

Future generation neutrino detectors

Hyper-Kamiokande

main detection channel

The DSNB event rates

Detectability prospects for 20 yrs

- HK (Gd) with NC:
 $\sim 10 \sigma$
- HK (Gd) w/o NC:
 $\sim 12.5 \sigma$

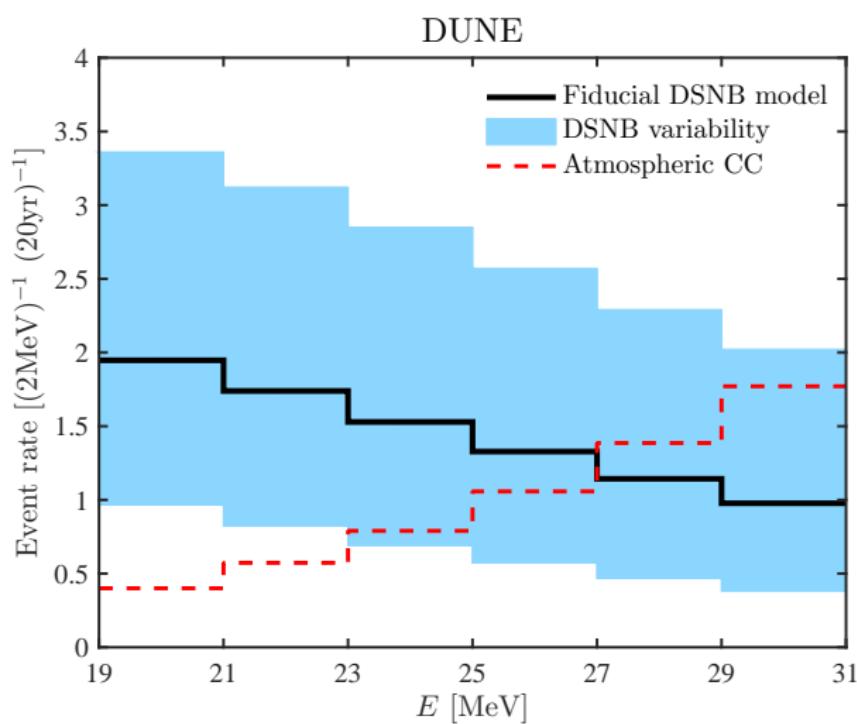

The DSNB event rates

Detectability prospects for 20 yrs

- HK (Gd) with NC: $\sim 10 \sigma$
- HK (Gd) w/o NC: $\sim 12.5 \sigma$
- JUNO: $\sim 3.4 \sigma$

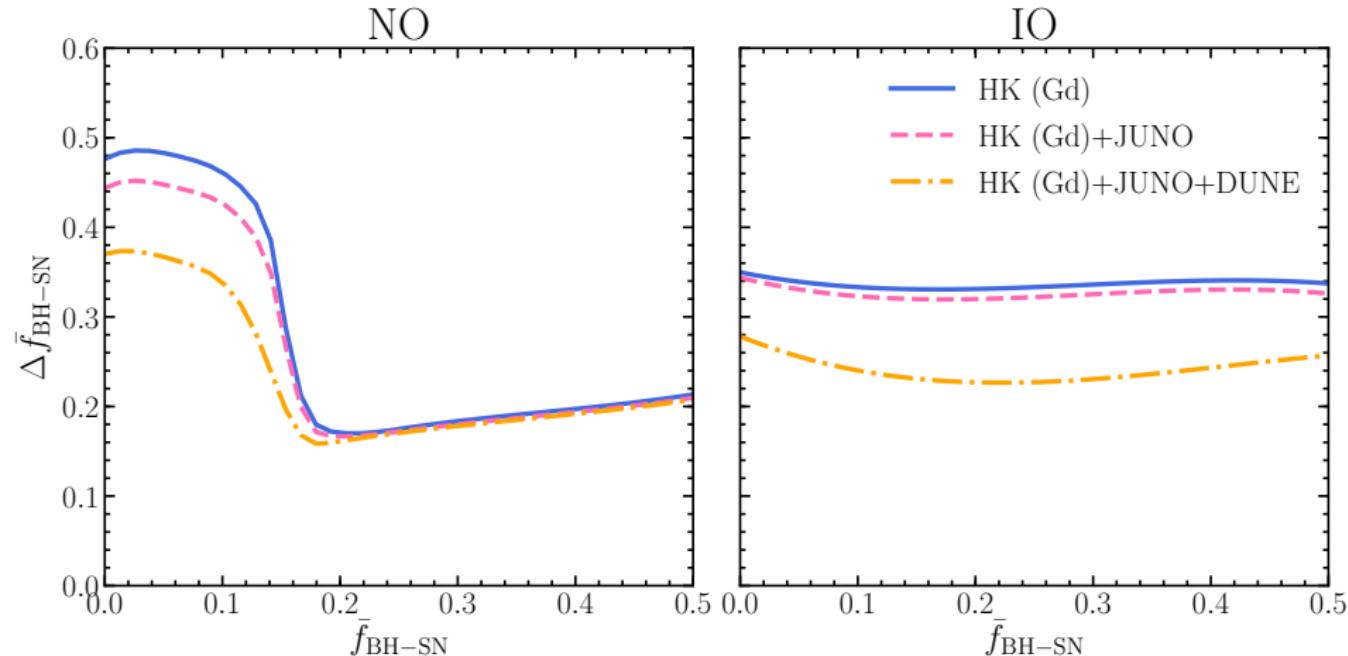

The DSNB event rates

Detectability prospects for 20 yrs

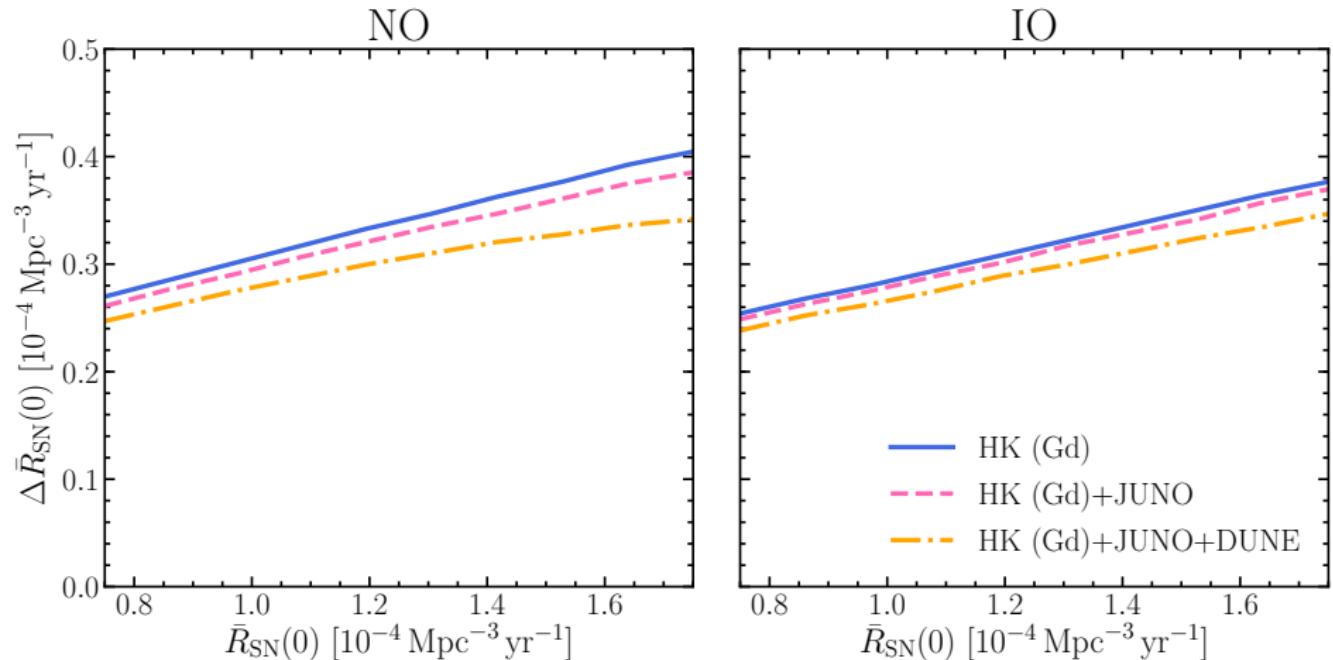

- HK (Gd) with NC: $\sim 10 \sigma$
- HK (Gd) w/o NC: $\sim 12.5 \sigma$
- JUNO: $\sim 3.4 \sigma$
- DUNE: $\sim 2.8 \sigma$

Expected 1σ uncertainty: fraction of BH forming progenitors

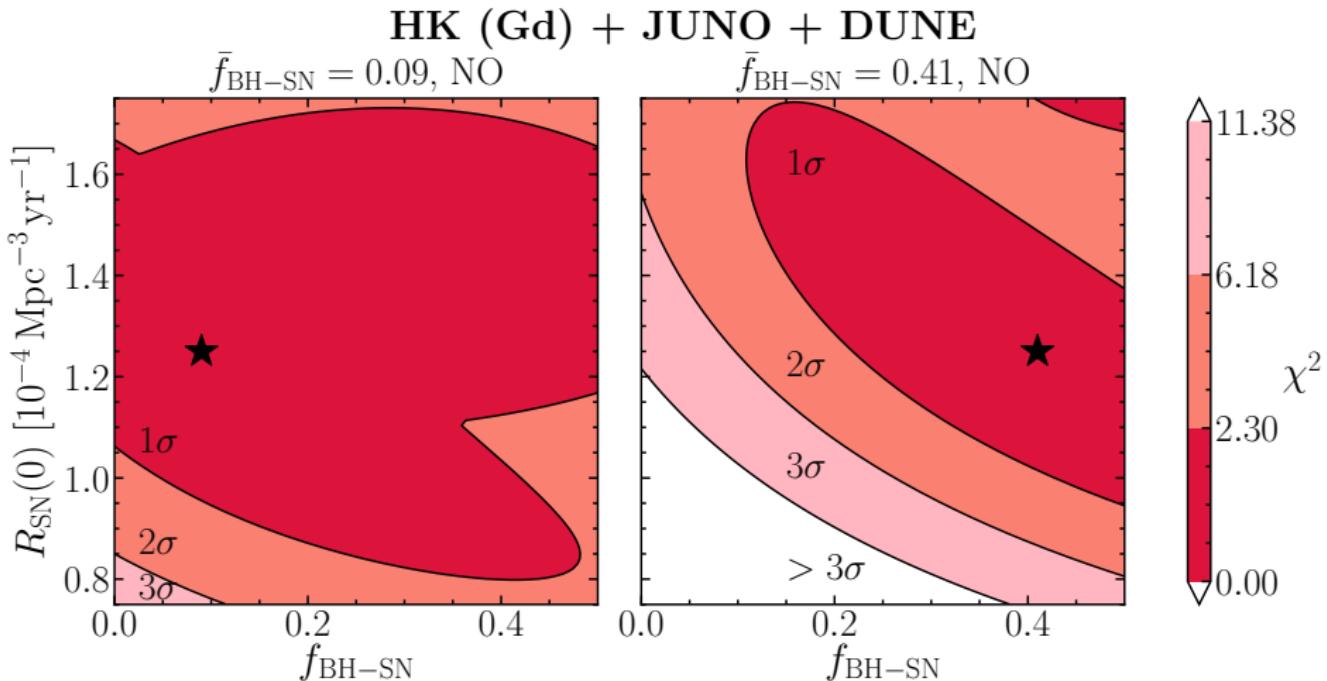

- The high uncertainty comes from $f_{\text{BH-SN}}$ -mass accretion rate degeneracy
- DUNE is sensitive to neutrinos → helps to reduce the uncertainty

Expected 1σ uncertainty: local supernova rate

Relative error of 20%-33% independent of the mass ordering.

Determining the supernovae unknowns with DSNB

Conclusions

Conclusions

- Future neutrino detectors will detect and measure the DSNB
- The DSNB
 - is sensitive to the fraction of BH forming progenitors
 - is sensitive to the local supernovae rate
 - shows weak discriminating power of the neutrino mass ordering

Conclusions

- Future neutrino detectors will detect and measure the DSNB
- The DSNB
 - is sensitive to the fraction of BH forming progenitors
 - is sensitive to the local supernovae rate
 - shows weak discriminating power of the neutrino mass ordering

Thank you!

proton - proton chain reactions, i.e.,

n-e separation: definition

Assumed uncertainties:

- $\Delta_{R_{\text{SN}}(0)} = 0.25 \times 10^{-4} \text{ Mpc}^{-3} \text{ yr}^{-1}$
- $\Delta_{f_{\text{BH-SN}}} = 0.2$
- $\Delta_{\text{BG}} = 20\%$
- $\Delta\sigma_{\text{LAr}} = 15\%$

Pull terms: $\chi_{\text{BG}}^2 = \left(\frac{x}{\Delta_{\text{BG}}} \right)^2$,

$$\chi_{R_{\text{SN}}(0)}^2 = \left(\frac{R_{\text{SN}}(0) - \bar{R}_{\text{SN}}(0)}{\Delta_{R_{\text{SN}}(0)}} \right)^2$$

Combined likelihood analysis

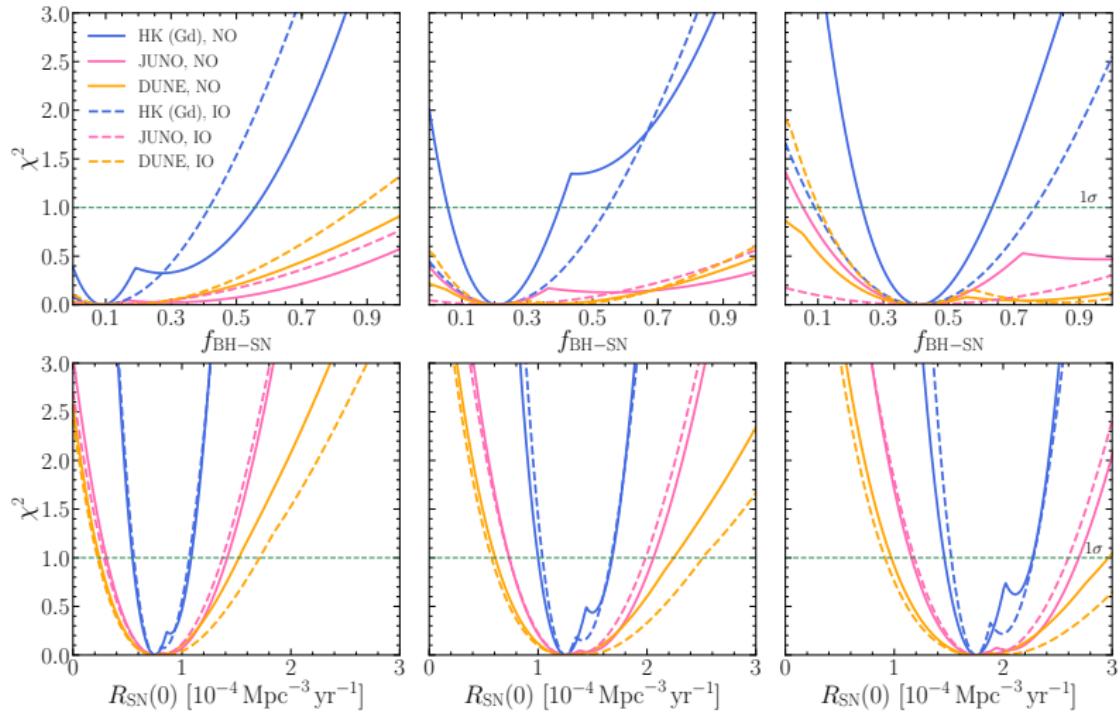

Significance test

$$\chi^2 = \min_A \left(\sum_j \chi_{A,j}^2 + \chi_{\text{HK}}^2 + \chi_{\text{JUNO}}^2 + \chi_{\text{DUNE}}^2 \right)$$

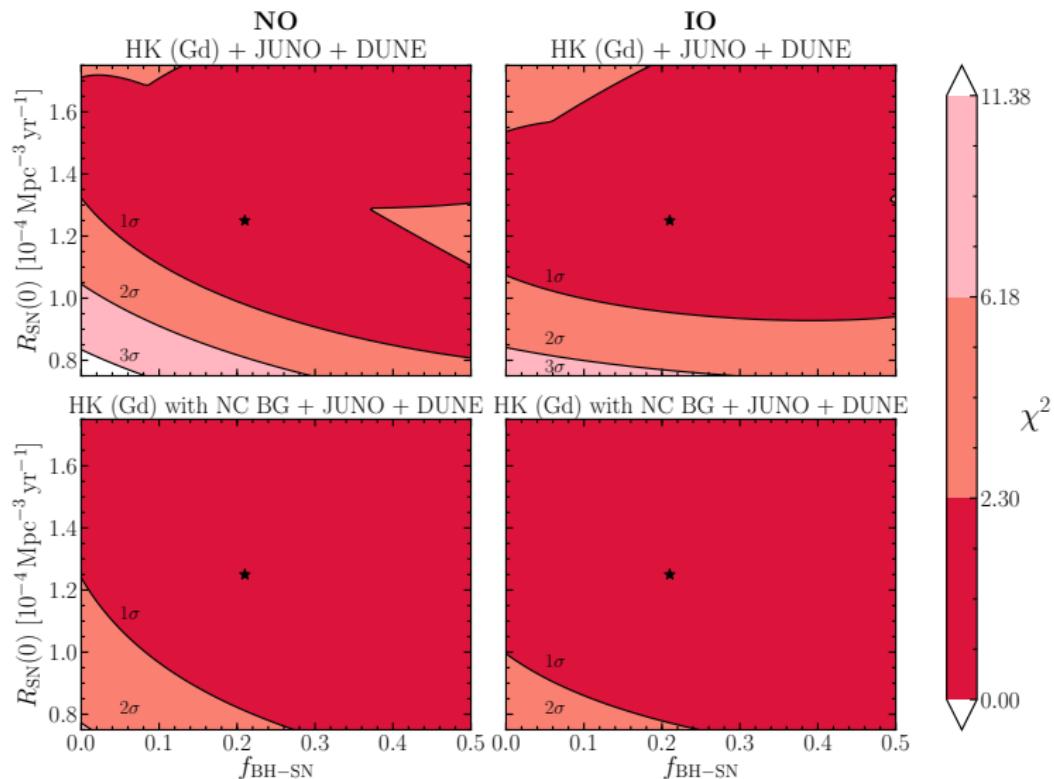

The set of parameters to be marginalized over:

- $f_{\text{BH-SN}}, \Delta f_{\text{BH-SN}} = 0.2$
- $R_{\text{SN}}(0), \Delta R_{\text{SN}(0)} = 0.25 \times 10^{-4} \text{ Mpc}^{-3} \text{ yr}^{-1}$
- background normalization uncertainty, $\Delta_{\text{BG}} = 20\%$
- liquid argon cross section uncertainty, $\Delta \sigma_{\text{LAr}} = 15\%$
- mass accretion rate - equation of state uncertainty

Expected 1D χ^2 as a function of $f_{\text{BH-SN}}$ and $R_{\text{SN}}(0)$

χ^2 for the fraction of BH forming progenitors - local supernova rate plane
